This document does **NOT** contain any PHI information.

# 1. Introduction

BI-Query aka GQL has been around for 25+ years. It is still one of the best **Query** tools for SQL detail queries.

Power-BI from Microsoft is a Business Intelligence tool that could benefit from the work done to create the BI-Query Models.

This effort is to see if it is possible to take exported BI-Query models and use them to help define Power-BI models with the identical attributes.

# 2. BI-Query model

The BI-Query model is a binary object and is difficult to read.

Bi-Query does have the method to export the model to a text file which if formatted correctly could be used for the migration.

An example of the exported BI-Query model can be found at this [link](#)
